

Accessibility in DITA and DITA-OT

DITA-OT Day Berlin, 2017

Robert D. Anderson, IBM

[@robander](https://twitter.com/robander)

What I expect you are expecting...

- Accessibility – what, why, and do I need it?
- Does DITA do it for me?
- Does DITA-OT do it for me?
 - Focus: HTML and HTML based outputs
- I really care about ... what do I have to do on my own?

Why am I the one talking?

Because Kris was not able
to make it.

Apologies to those who have to
listen to too much of me today!

What do we mean by accessibility?

- Is content ...
 - Available to everyone?
 - Understandable by everyone?
 - Usable by everyone?
 - On every device?
 - Regardless of any disabilities / impairments?

Is it important to be accessible?

Yes.

Why?

Whatever the goal of your content...

If any person can't use your content ...

then they *won't* use your content.

Which means they won't be your customer.

Now or in the future.

But if you need hard data...

- World Health Organization estimated in 2011 that over one billion people live with disabilities.
- This number is increasing due to ageing population + increase in chronic diseases / conditions.
- Anybody can move into / out of the “disabled” category at any time

Additional business drivers

- If reaching more people isn't enough...
- ... many organizations (governments, businesses) mandate compliance
- For example, US Government and WCAG compliance

WCAG: Web Content Accessibility Guidelines

- Primarily for online content
- Addresses various methods of access (mobile, browser)
- Focus for this presentation: how to ensure your online content is accessible, complies with these guidelines
- <https://www.w3.org/WAI/intro/wcag>

Does DITA comply with WCAG?

... is not *quite* the right question.

Your DITA editor likely needs to be accessible.

DITA itself is usually rendered as something else: HTML, PDF, etc.

Accessibility for DITA is most concerned with that final presentation.

But you *can* make your DITA more accessible

- Content is content, regardless where it starts or how stored
- Good writing good.
Remember to write good.
- Start by writing clearly,
using simple sentences,
using the right terminology for
your audience

Beyond the quality of the text...

What does DITA do for you?

- In many cases, Web Accessibility is about conveying semantic information in multiple ways
- As a semantic language, DITA stores that information with content
- Tools that render DITA should convey that in any way necessary

Is this obviously a heading?

Sure, if you can see it.

What about this?	Is this a heading?
Sure it is.	Again ... if you can see it.
But what ifsomething is reading it to you?

Preserving semantics

- DITA headings in `<title>` should retain heading markup
- Table entries in `<thead>` should do whatever is necessary to associate headers with entries
- Images should use `<alt>` to specify alternative text

Is this obviously a heading?

Sure, if you can see it.

What about this?	Is this a heading?
Sure it is.	Again ... if you can see it.
But what ifsomething is reading it to you?

Example: Image with alternative text

Proper method:

```
<image href="puffin.png">  
  <alt>Proud puffin with fish</alt>  
</image>
```

Old method (deprecated):

```
<image href="puffin.png"  
  alt="Proud puffin with fish"/>
```

Example: Alt text with @keyref

New in DITA-OT 3.0: key definition with `<linktext>` or `<navtitle>` provides alt text:

```
<image keyref="proudPuffin"/>
```

Key definition:

```
<keydef keys="proudPuffin"  
  href="puffin.png" format="image">
```

```
<topicmeta>
```

```
  <linktext>Proud puffin with fish</linktext>
```

```
</topicmeta>
```

```
</keydef>
```

Ever seen a really complex image?

When `<alt>` isn't enough...

```
<image keyref="iceroad">  
  <alt>Rules of  
    the road</alt>  
  <longdescref  
    href="roadsign.dita"/>  
</image>
```

What about tables?

- Most table accessibility can be automated with DITA 1.0 markup
 - Use `<thead>` or `<sthead>` for header row or header rows
 - Use `<table rowheader="firstcol">` or `<simpletable keycol="1">` if first column contains headers

Team	Wins	Losses
Dragons	9	1
Wizards	8	2
Giants	2	8
Hobbits	1	9

What about really complex tables?

- New markup available in DITA 1.3
 - Allows for multiple header columns
 - Also allows manual control of all accessibility (not advised for most cases)

Category	Animal	Good for petting	Cuddly
Good animals	Cat	Yes	If in the mood
	Dog	Yes	Almost always
Scary animals	Crocodile	No	Only when young
	Shark	No	Never

DITA Markup: summary

- ✓ Ensure your content is well written
- ✓ Ensure your content is marked up properly
 - ✓ Use header markup for headers
 - ✓ Use semantic elements where available
- ✓ Provide alternate text for your images

What does DITA-OT do for you?

- Preserve semantics where possible
 - Lists preserve list markup
 - Headings are headings, not “bold paragraphs”
 - Alternative text is placed in `img/@alt`
 - Use CSS to style based on source

- Automated ARIA role attributes

- Provides screen readers with information about page regions

```
<main role="main">
```

```
  <article role="article" aria-labelledby="ariaid-title1">
```

```
    <h1 id="ariaid-title1">Topic title</h1>
```

Surely that's not all...

- Generate accessible version of symbols
 - DITA-OT 2.5 added text for > character between menu items
 - “Use File > Open” => Reads as “Use File and then Open”
- Table headers ... oh ... table headers. Always the table headers.

Complex tables		Make life fun	
Merged cells	And spanned rows	Are like a party	A birthday party

Anybody suddenly nervous?

Table headers and accessibility

- Old way: every cell associated with header
 - Uses generated `@id` and `@headers`
 - Based off of `<thead>` and `@rowheaders` / `<sthead>` and `@keycol`
 - Automated for all tables prior to DITA-OT 3.0
 - Still used for `<table>`

Generated @id and @headers?

@id=gen1	@id=gen2	@id=gen3	@id=gen4
@id=gen5 @headers=gen1	@headers=gen2 gen5	@headers=gen3 gen5	@headers=gen4 gen5
@id=gen6 @headers=gen1	@headers=gen2 gen6	@headers=gen3 gen6	@headers=gen4 gen6

Table headers and accessibility

- Old way: every cell associated with header
 - Uses generated `@id` and `@headers`
 - Based off of `<thead>` and `@rowheaders` / `<sthead>` and `@keycol`
 - Automated for all tables prior to DITA-OT 3.0
 - Still used for `<table>`
- New way: scoping and `<th>`
 - Support was not widespread back in toolkit 1.0
 - DITA-OT 3.0 shifts to this for `<simpletable>`
 - Expected in 3.1 for `<table>`

Scoping and <th>?

@scope=col	@scope=col	@scope=col	@scope=col
@scope=row			
@scope=row			

Table headers and accessibility

- Old way: every cell associated with header
 - Uses generated `@id` and `@headers`
 - Based off of `<thead>` and `@rowheaders` / `<sthead>` and `@keycol`
 - Automated for all tables prior to DITA-OT 3.0
 - Still used for `<table>`
- New way: scoping and `<th>`
 - Support was not widespread back in toolkit 1.0
 - DITA-OT 3.0 shifts to this for `<simpletable>`
 - Expected in 3.1 for `<table>`
- Support for new DITA 1.3 markup coming

Table “summary”

- No dedicated DITA element or attribute equates to HTML `table/@summary`
 - Intended for longer summary of table
 - `<desc>` is similar, but intended for display
 - Not visible in browser, but available to screen readers
- Writing advice I learned:
 - Use good captions
 - Use descriptive text for all consumers of the topic
- Seems in flux for HTML5
 - DITA 2.0 may follow lead of HTML5

PDF accessibility

- Is more complicated.
- Depends on PDF, as well as rendering tool
 - FOP, XEP, AH
- Don't have dedicated resource for this today

When something is missing or broken

Open an issue at GitHub!

<https://github.com/dita-ot/dita-ot/issues>

Currently open accessibility tasks:

<https://github.com/dita-ot/dita-ot/labels/accessibility>

Example: DITA-OT 3.0 updates related links for WCAG 2.0

Updates more likely with HTML5 than XHTML
